the connecting fixed part comprises a fixed portion, and the fixed portion is fixedly arranged in the fixed support; an arc-shaped installing portion is connected to one side of the fixed portion, and the installing portion is inserted into a connecting plate;

a first arc-shaped installing groove is formed in the connecting plate, and the installing portion is inserted into the first installing groove; first arc-shaped sliding blocks are arranged in the first installing groove; first slideways corresponding to the first sliding blocks are arranged in the installing portion

the connecting plate is inserted into a movable support, and the movable support is located in the fixed support; a second arc-shaped installing groove is formed in the movable support, and the connecting plate is inserted into the second installing groove; second arc-shaped sliding blocks are arranged in the second installing groove, and second slideways corresponding to the second sliding blocks are arranged on the connecting plate; and

a torsion washer is arranged between each side of the movable support and the fixed support, one side of each of the torsion gaskets is slidably arranged on the fixed support, and the other side of each of the torsion gaskets and the movable support are in hinged connection.

As an improvement, kidney-shaped holes are formed in the fixed support, and sliding blocks are slidably arranged in the kidney-shaped holes and are fixedly arranged on the torsion gaskets.

2

As an improvement, a connecting fixed shaft is fixedly arranged between two torsion gaskets.

As an improvement, a fixed shaft for supporting the fixed support is fixedly arranged between both ends of the fixed support.

After the above technical solution is adopted, the disclosure has the following beneficial effects:

The overturning and supporting rotating shaft for the tablet computer comprises a fixed support, wherein a connecting fixed part is fixedly arranged in the fixed support by a fastener; the connecting fixed part comprises a fixed portion which is fixedly arranged in the fixed support; an arc-shaped installing portion is fixedly connected to one side of the fixed portion and is inserted into a connecting plate; a first arc-shaped installing groove is formed in the connecting plate, and the installing portion is inserted into the first installing groove; first arc-shaped sliding blocks are arranged in the first installing groove, and first slideways corresponding to the first sliding blocks are arranged in the installing portion;

the connecting plate is inserted into the movable support which is located in the fixed support; a second arc-shaped installing groove is formed in the movable support, and the connecting plate is inserted into the second installing groove; second arc-shaped sliding blocks are arranged in the second installing groove, and second slideways corresponding to the second sliding blocks are arranged on the connecting plate; and a torsion washer is arranged between each side of the movable support and the fixed support, one side of each torsion gasket is slidably arranged on the fixed support, and the other side of each torsion gasket and the movable support are in hinged connection. The rotation of the overturning and supporting rotating shaft within a range of 120 degrees is realized by matching of arc-shaped structures among the connecting fixed part, the connecting plate and the movable support, and movement assisted by connecting the torsion gaskets and the fixed support.

The kidney-shaped holes are formed in the fixed support, the sliding blocks are slidably arranged in the kidney-shaped holes and are fixedly arranged on the torsion gaskets, when the movable support is overturned, due to the change of the center, the sliding structure is simple by adopting the design of the kidney-shaped holes, and meanwhile, the adjustment allowance is reserved, the successful implementation of overturning is ensured.

As the connecting fixed shaft is fixedly arranged between the two torsion gaskets, the lateral deviation in the overturning process is prevented.

The fixed shaft for supporting the fixed support is fixedly arranged between both ends of the fixed support, thus, the fixed support is further stabilized, and the successful implementation of the overturning is ensured.

In conclusion, the disclosure solves the defects in the prior art that the portability and aesthetics are affected by adding the extra shell, the overturning and supporting rotating shaft can be overturned within a range of 0 to 120 degrees, is convenient to use, and meanwhile, enables a bracket support of the whole machine to fit better with the rear shell. The overturning and supporting rotating shaft is attractive in appearance, neat, small in size and long in service life.
